Chapter 4 Network Layer: The Data Plane

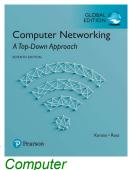

A note on the use of these Powerpoint slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a lot of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

Computer Networking: A Top Down Approach

7th Edition, Global Edition Jim Kurose, Keith Ross Pearson April 2016

Network Laver: Data Plane 4-1

Chapter 4: outline

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

Network Layer: Data Plane 4-2

Chapter 4: network layer

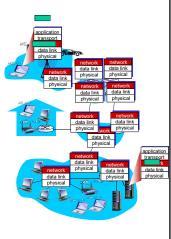

chapter goals:

- understand principles behind network layer services, focusing on data plane:
 - · network layer service models
 - forwarding versus routing
 - · how a router works
 - generalized forwarding
- instantiation, implementation in the Internet

Network Layer: Data Plane 4-3

Network layer

- transport segment from sending to receiving host
- on sending side encapsulates segments into datagrams
- on receiving side, delivers segments to transport layer
- network layer protocols in every host, router
- router examines header fields in all IP datagrams passing through it

Two key network-layer functions

network-layer functions:

- •forwarding: move packets from router's input to appropriate router output
- •routing: determine route taken by packets from source to destination
 - routing algorithms

analogy: taking a trip

- forwarding: process of getting through single interchange
- routing: process of planning trip from source to destination

Network Layer: Data Plane 4-5

Individual routing algorithm components in each and every router interact in the control plane Network Layer: Control Plane 5-7

Network layer: data plane, control plane

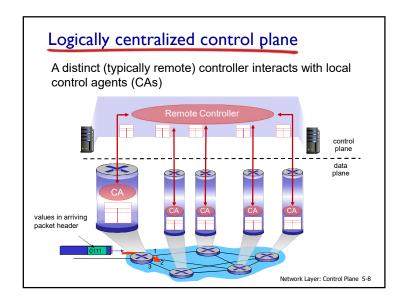

Data plane

- local, per-router function
- determines how datagram arriving on router input port is forwarded to router output port
- forwarding function

values in arriving packet header

Control plane

- network-wide logic
- determines how datagram is routed among routers along end-end path from source host to destination host
- two control-plane approaches:
 - traditional routing algorithms: implemented in routers
 - software-defined networking (SDN): implemented in (remote) servers

Network service model

Q: What service model for "channel" transporting datagrams from sender to receiver?

example services for individual datagrams:

- guaranteed delivery
- guaranteed delivery with less than 40 msec delay

example services for a flow of datagrams:

- in-order datagram delivery
- guaranteed minimum bandwidth to flow
- restrictions on changes in inter-packet spacing

Network Layer: Data Plane 4-9

Chapter 4: outline

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

Network Layer: Data Plane 4-11

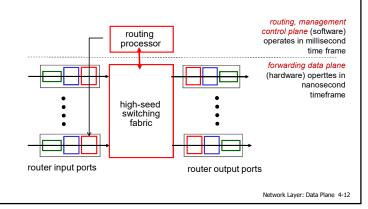

Network layer service models:

	Network	Service Model	Guarantees ?				Congestion
Architectu Intern	hitecture		Bandwidth	Loss	Order	Timing	feedback
	Internet	best effort	none	no	no	no	no (inferred via loss)
	ATM	CBR	constant	yes	yes	yes	no
			rate				congestion
	ATM	VBR	guaranteed	yes	yes	yes	no
			rate				congestion
	ATM	ABR	guaranteed minimum	no	yes	no	yes
	ATM	UBR	none	no	yes	no	no

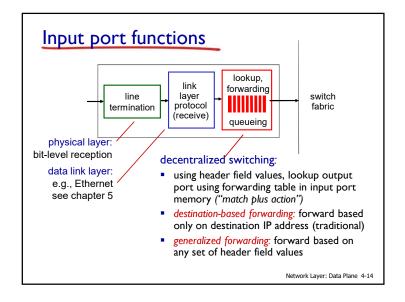

Network Layer: Data Plane 4-10

Router architecture overview

• high-level view of generic router architecture:

Longest prefix matching

- longest þrefix matching –

when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

Destination	Address Ra	nge		Link interface
11001000	00010111	00010***	******	0
11001000	00010111	00011000	*****	1
11001000	00010111	00011***	*****	2
otherwise				3

examples:

DA: 11001000 00010111 0001<mark>0110 10100001</mark>
DA: 11001000 00010111 00011000 10101010

which interface? which interface?

Longest prefix matching

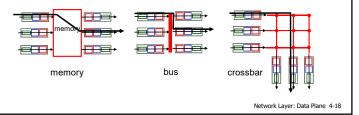

- we'll see why longest prefix matching is used shortly, when we study addressing
- longest prefix matching: often performed using ternary content addressable memories (TCAMs)
 - content addressable: present address to TCAM: retrieve address in one clock cycle, regardless of table size
 - Cisco Catalyst: can up ~IM routing table entries in TCAM

Network Layer: Data Plane 4-17

Switching via memory first generation routers: traditional computers with switching under direct control of CPU packet copied to system's memory • speed limited by memory bandwidth (2 bus crossings per datagram) input output port port memory (e.g., Ethernet) Ethernet) system bus Network Layer: Data Plane 4-19

Switching fabrics

- transfer packet from input buffer to appropriate output buffer
- switching rate: rate at which packets can be transfer from inputs to outputs
 - often measured as multiple of input/output line rate
 - N inputs: switching rate N times line rate desirable
- three types of switching fabrics

Switching via a bus

- datagram from input port memory to output port memory via a shared bus
- bus contention: switching speed limited by bus bandwidth
- 32 Gbps bus, Cisco 5600: sufficient speed for access and enterprise routers

bus

Switching via interconnection network

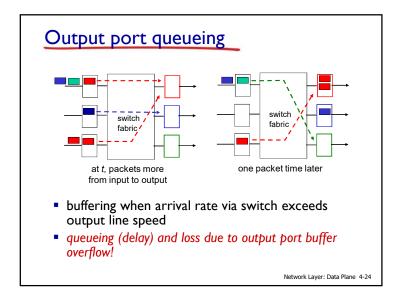

- overcome bus bandwidth limitations
- banyan networks, crossbar, other interconnection nets initially developed to connect processors in multiprocessor
- advanced design: fragmenting datagram into fixed length cells, switch cells through the fabric.
- Cisco 12000: switches 60 Gbps through the interconnection network

Network Layer: Data Plane 4-21

This slide in HUGELY important! Output ports datagram switch buffer link line fabric layer termination protocol (send) buffering required Datagram (packets) can be lost from fabric faster | due to congestion, lack of buffers rate scheduling Priority scheduling – who gets best datagrams performance, network neutrality Network Layer: Data Plane 4-23

Input port queuing fabric slower than input ports combined -> queueing may occur at input queues • queueing delay and loss due to input buffer overflow! Head-of-the-Line (HOL) blocking: queued datagram at front of queue prevents others in queue from moving forward fabric fabric/ output port contention: one packet time later: only one red datagram can be green packet transferred. experiences HOL lower red packet is blocked blocking Network Layer: Data Plane 4-22

How much buffering?

- RFC 3439 rule of thumb: average buffering equal to "typical" RTT (say 250 msec) times link capacity C
 - e.g., C = 10 Gpbs link: 2.5 Gbit buffer
- recent recommendation: with N flows, buffering equal to

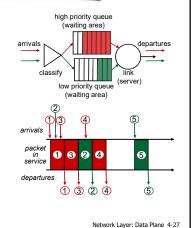

Network Layer: Data Plane 4-25

Scheduling policies: priority

priority scheduling: send highest priority queued packet

- multiple classes, with different priorities
 - class may depend on marking or other header info, e.g. IP source/dest, port numbers, etc.
 - real world example?

Scheduling mechanisms

- scheduling: choose next packet to send on link
- FIFO (first in first out) scheduling: send in order of arrival to queue
 - real-world example?
 - discard policy: if packet arrives to full queue: who to discard?
 - tail drop: drop arriving packet
 - priority: drop/remove on priority basis
 - random: drop/remove randomly

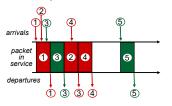

Network Layer: Data Plane 4-26

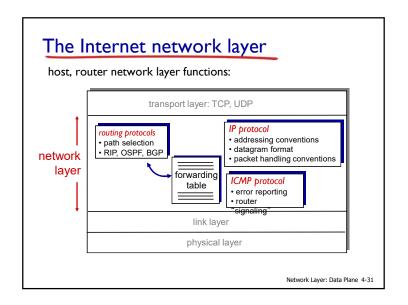

Scheduling policies: still more

Round Robin (RR) scheduling:

- multiple classes
- cyclically scan class queues, sending one complete packet from each class (if available)
- real world example?

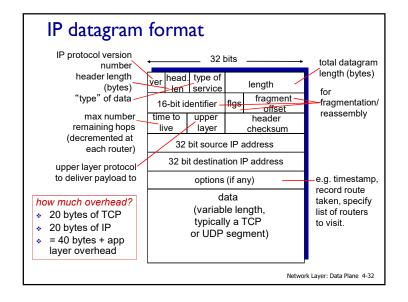

Scheduling policies: still more Weighted Fair Queuing (WFQ): • generalized Round Robin • each class gets weighted amount of service in each cycle • real-world example? Classify arrivals was a policies: still more Network Layer: Data Plane 4-29

Chapter 4: outline

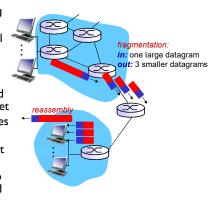

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

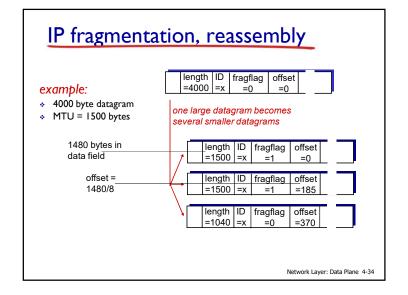

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

- network links have MTU (max.transfer size) largest possible link-level frame
 - different link types, different MTUs
- large IP datagram divided ("fragmented") within net
 - one datagram becomes several datagrams
 - "reassembled" only at final destination
 - IP header bits used to identify, order related fragments

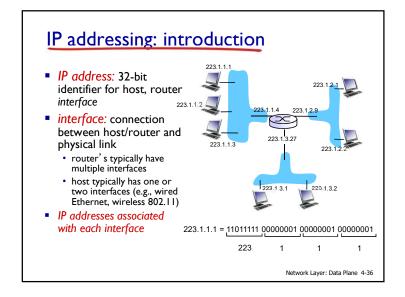

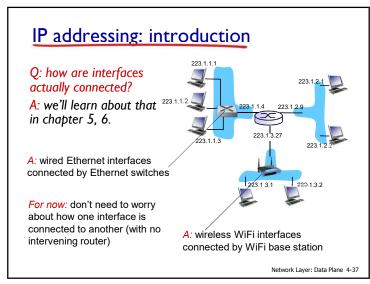

Chapter 4: outline

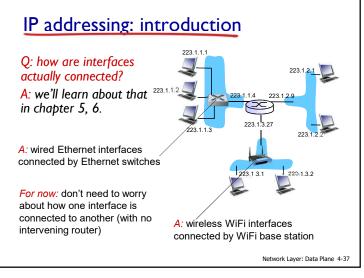

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

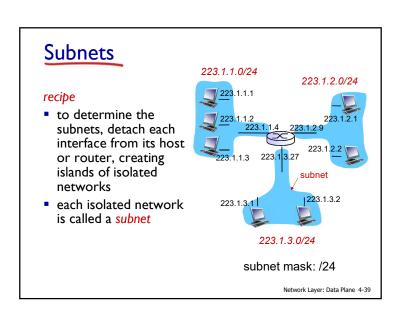

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

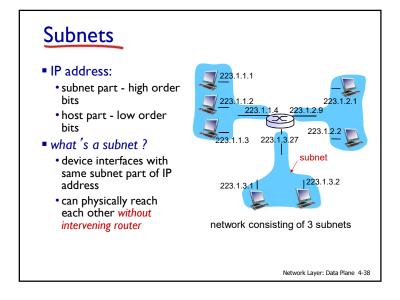

Network Layer: Data Plane 4-35

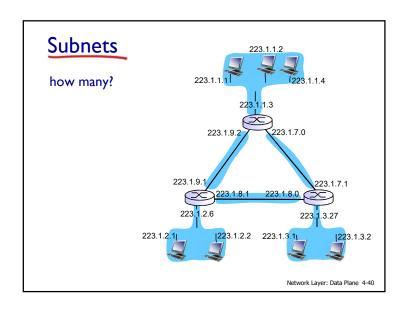

IP addressing: CIDR

CIDR: Classless InterDomain Routing

- subnet portion of address of arbitrary length
- address format: a.b.c.d/x, where x is # bits in subnet portion of address

subnet host part 11001000 00010111 00010000 000000000 200,23,16,0/23

Network Laver: Data Plane 4-41

Q: How does a host get IP address?

IP addresses: how to get one?

- hard-coded by system admin in a file
 - Windows: control-panel->network->configuration->tcp/ip->properties
 - UNIX: /etc/rc.config
- DHCP: Dynamic Host Configuration Protocol: dynamically get address from as server
 - "plug-and-play"

Network Layer: Data Plane 4-42

DHCP: Dynamic Host Configuration Protocol

goal: allow host to dynamically obtain its IP address from network server when it joins network

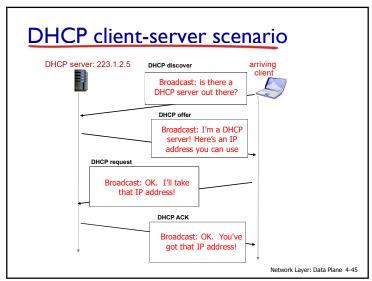

- · can renew its lease on address in use
- allows reuse of addresses (only hold address while connected/"on")
- support for mobile users who want to join network (more shortly)

DHCP overview:

- host broadcasts "DHCP discover" msg [optional]
- DHCP server responds with "DHCP offer" msg [optional]
- host requests IP address: "DHCP request" msg
- DHCP server sends address: "DHCP ack" msg

Network Layer: Data Plane 4-43

DHCP client-server scenario 223.1.1.0/24 DHCP server 223.1.2.1 223.1.1.1 223.1.2.9 arriving DHCP client needs address in this network 223.1.3.1 223.1.3.2 223.1.3.2 Petwork Layer: Data Plane 4-44

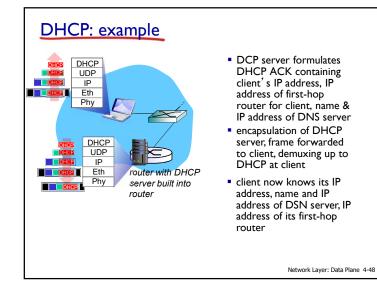

DHCP: example DHCP connecting laptop needs UDP its IP address, addr of ΙP first-hop router, addr of Eth DNS server: use DHCP DHCP request encapsulated in UDP, encapsulated in IP, encapsulated in 802.1 UDP Ethernet ΙP Ethernet frame broadcast Eth router with DHCP (dest: FFFFFFFFFF) on LAN, server built into received at router running router DHCP server Ethernet demuxed to IP demuxed, UDP demuxed to DHCP

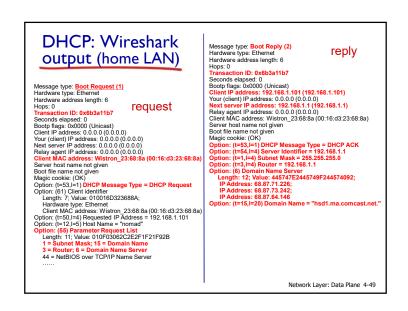

Network Layer: Data Plane 4-47

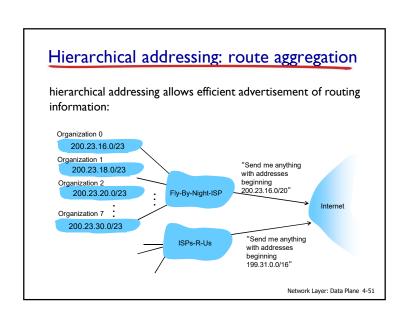

DHCP: more than IP addresses

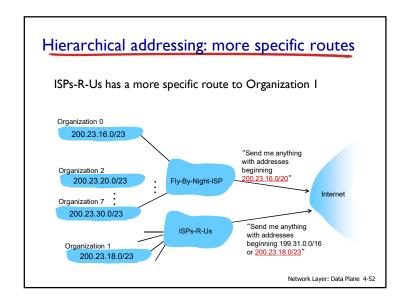

DHCP can return more than just allocated IP address on subnet:

- · address of first-hop router for client
- name and IP address of DNS sever
- network mask (indicating network versus host portion of address)

IP addressing: the last word...

Q: how does an ISP get block of addresses?

A: ICANN: Internet Corporation for Assigned Names and Numbers http://www.icann.org/

- allocates addresses
- manages DNS
- assigns domain names, resolves disputes

Network Layer: Data Plane 4-53

NAT: network address translation

motivation: local network uses just one IP address as far as outside world is concerned:

- range of addresses not needed from ISP: just one IP address for all devices
- can change addresses of devices in local network without notifying outside world
- can change ISP without changing addresses of devices in local network
- devices inside local net not explicitly addressable, visible by outside world (a security plus)

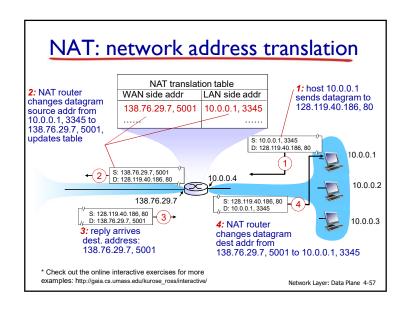

Network Layer: Data Plane 4-55

NAT: network address translation rest of local network Internet (e.g., home network) 10.0.0.1 10.0.0/24 10.0.0.2 138.76.29 10.0.0.3 all datagrams leaving local datagrams with source or network have same single destination in this network source NAT IP address: have 10.0.0/24 address for source, destination (as usual) 138.76.29.7.different source port numbers Network Laver: Data Plane 4-54

NAT: network address translation

implementation: NAT router must:

- outgoing datagrams: replace (source IP address, port #) of every outgoing datagram to (NAT IP address, new port #)
 ... remote clients/servers will respond using (NAT IP address, new port #) as destination addr
- remember (in NAT translation table) every (source IP address, port #) to (NAT IP address, new port #) translation pair
- incoming datagrams: replace (NAT IP address, new port #) in dest fields of every incoming datagram with corresponding (source IP address, port #) stored in NAT table

Chapter 4: outline

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

Network Layer: Data Plane 4-59

NAT: network address translation

- 16-bit port-number field:
 - 60,000 simultaneous connections with a single LAN-side address!
- NAT is controversial:
 - routers should only process up to layer 3
 - address shortage should be solved by IPv6
 - violates end-to-end argument
 - NAT possibility must be taken into account by app designers, e.g., P2P applications
 - NAT traversal: what if client wants to connect to server behind NAT?

Network Laver: Data Plane 4-58

IPv6: motivation

- initial motivation: 32-bit address space soon to be completely allocated.
- additional motivation:
 - header format helps speed processing/forwarding
 - header changes to facilitate QoS

IPv6 datagram format:

- fixed-length 40 byte header
- · no fragmentation allowed

IPv6 datagram format

priority: identify priority among datagrams in flow flow Label: identify datagrams in same "flow."

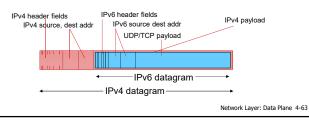

(concept of flow not well defined).

next header: identify upper layer protocol for data

ver	pri		flow labe	l	
р	ayload	llen	next hdr	hop limit	t
			address bits)		
			on address B bits)		
		da	ta		
		32	bits —		Netw

Transition from IPv4 to IPv6

- not all routers can be upgraded simultaneously
 - no "flag days"
 - how will network operate with mixed IPv4 and IPv6 routers?
- tunneling: IPv6 datagram carried as payload in IPv4 datagram among IPv4 routers

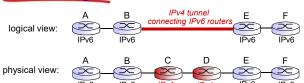

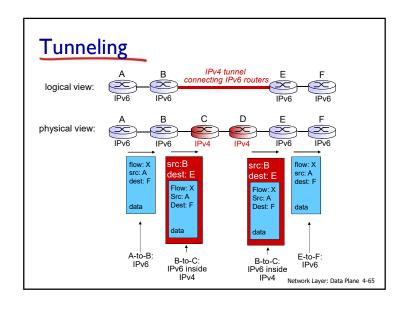

Other changes from IPv4

- checksum: removed entirely to reduce processing time at each hop
- options: allowed, but outside of header, indicated by "Next Header" field
- ICMPv6: new version of ICMP
 - additional message types, e.g. "Packet Too Big"
 - multicast group management functions

Network Layer: Data Plane 4-62

Tunneling

IPv6: adoption

- Google: 8% of clients access services via IPv6
- NIST: 1/3 of all US government domains are IPv6 capable
- Long (long!) time for deployment, use
 - •20 years and counting!
 - *think of application-level changes in last 20 years: WWW, Facebook, streaming media, Skype, ...
 - •Why?

Network Layer: Data Plane 4-66

Chapter 4: outline

- 4.1 Overview of Network layer
 - data plane
 - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - IPv4 addressing
 - network address translation
 - IPv6

- 4.4 Generalized Forward and SDN
 - match
 - action
 - OpenFlow examples of match-plus-action in action

Network Layer: Data Plane 4-67

Each router contains a flow table that is computed and distributed by a logically centralized routing controller control plane data plane values in arriving packet's header Network Layer: Data Plane 4-68

OpenFlow data plane abstraction

- flow: defined by header fields
- generalized forwarding: simple packet-handling rules
 - Pattern: match values in packet header fields
 - Actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
 - Priority: disambiguate overlapping patterns
 - Counters: #bytes and #packets

Flow table in a router (computed and distributed by controller) define router's match+action rules

Network Layer: Data Plane 4-69

OpenFlow: Flow Table Entries Rule Action Stats Packet + byte counters 1. Forward packet to port(s) 2. Encapsulate and forward to controller 3. Drop packet 4. Send to normal processing pipeline 5. Modify Fields Switch VLAN MAC MAC dst Dst Transport layer Link layer Network layer

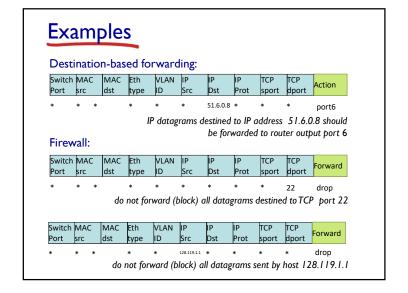

OpenFlow data plane abstraction

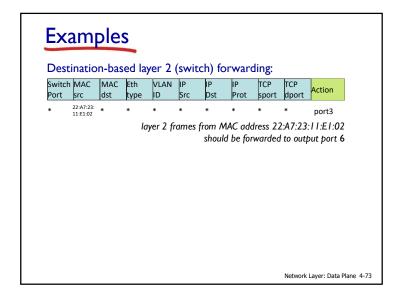

- flow: defined by header fields
- generalized forwarding: simple packet-handling rules
 - Pattern: match values in packet header fields
 - Actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
 - Priority: disambiguate overlapping patterns
 - Counters: #bytes and #packets

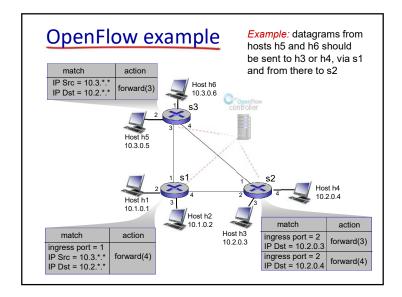

* : wildcard

- 1. src=1.2.*.*, dest=3.4.5.* → drop
- 2. $src = *.*.*.*, dest=3.4.*.* \rightarrow forward(2)$
- 3. src=10.1.2.3, $dest=*.*.*.* \rightarrow send to controller$

OpenFlow abstraction

- match+action: unifies different kinds of devices
- Router
 - match: longest destination IP prefix
 - action: forward out a link
- Switch
 - match: destination MAC address
 - action: forward or flood

- Firewall
- match: IP addresses and TCP/UDP port numbers
- action: permit or deny
- NAT
 - match: IP address and port
 - action: rewrite address and port

Network Layer: Data Plane 4-74

Chapter 4: done!

- 4.1 Overview of Network layer: data plane and control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
 - datagram format
 - fragmentation
 - ii agiiiciitatioii
 - IPv4 addressing
 - NAT
 - IPv6

- 4.4 Generalized Forward and SDN
 - · match plus action
 - OpenFlow example

Question: how do forwarding tables (destination-based forwarding) or flow tables (generalized forwarding) computed?

Answer: by the control plane (next

chapter)
